Statement:

I am trying to help people grow their NBA basketball knowledge by testing them on basic trivia related to NBA history. I see too many people pretending to know about basketball, so this will test whether they really know basketball or not.

What I am Building:

I am going to build a java program that quizzes the user on basic NBA questions. It will give you questions like 'who scored more points in their career, LeBron James or Michael Jordan?' It will track your score over time and give you a score based on your answers.

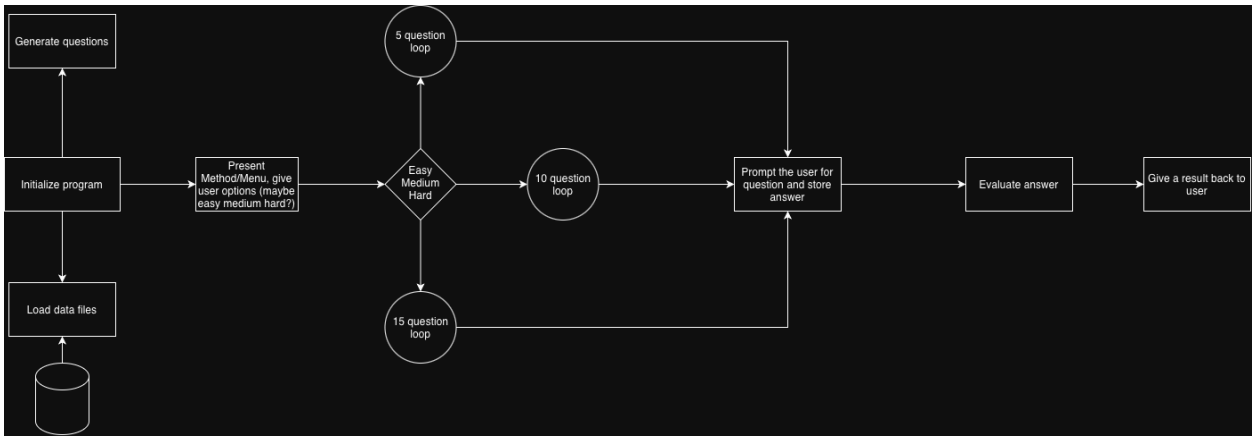

Tech Stack:

- Program language: Java
- Data storage: Comma-separated data files
- Data source: TBD, search for internet archives (Maybe basketball-reference.com)
- Libraries: Java CSV parser

Milestones:

1. Settle on MVP features
2. Complete the basic design
3. Basic input prompts and outputs
4. Download and structure data files
5. Build file parser
6. Build trivia loop
7. Build trivia comparison
8. Build scoring system
9. Polish
10. User testing
